

Feature: AI-Assisted Customer Visit Registration via Voice

Feature Name

AI Voice Agent for Customer Visit Registration and Salesforce Data Capture

Feature Overview

This feature enables a sales agent to register customer visit details through a conversational AI assistant triggered automatically upon arrival at a scheduled customer location.

Using geolocation services tied to the Schedule Agenda, the application detects when the sales agent arrives at a predefined customer visit location and prompts the user to begin a voice-driven interaction.

The AI assistant asks natural conversational questions to collect relevant Salesforce CRM information associated with:

- Event Activities
- Opportunities
- Accounts
- Tasks / Follow-Ups
- Visit Outcomes
- Notes and Action Items

The captured information is then mapped into Salesforce-related objects and fields.

The feature also allows the sales agent to attach screenshots, notes, or supporting evidence during or after the interaction.

Business Goal

Reduce manual CRM updates and increase sales activity tracking accuracy by allowing sales agents to naturally document customer visits through voice interactions directly integrated with Salesforce structures.

User Story

Title

AI Voice Assistant for Customer Visit Registration

User Story

As a sales agent

I want an AI assistant to automatically prompt me to register my customer visit details through voice interaction when I arrive at a scheduled location

So that I can quickly document meetings, opportunities, activities, and account updates without manually entering CRM information.

Actors

- Sales Agent
- AI Voice Assistant

- Salesforce CRM Integration Service
 - Mobile Notification Service
 - GPS / Geofencing Service
-

Preconditions

- Sales agent is authenticated in the mobile app
 - A scheduled customer visit exists in the Schedule Agenda
 - Customer location coordinates are configured
 - User granted location and microphone permissions
 - Salesforce integration is active
-

Trigger

The sales agent enters the configured geofenced area of a scheduled customer visit.

Main Flow

Step 1 – Arrival Detection

The application detects that the sales agent has arrived within the predefined radius of the scheduled customer location.

Step 2 – Visit Notification

The user receives a push notification such as:

“You have arrived at your scheduled customer visit for Acme Corporation. Would you like to register your visit details using AI voice assistance?”

Options:

- Start Voice Registration
 - Remind Me Later
 - Dismiss
-

Step 3 – Voice Assistant Launch

When the user accepts:

- The AI voice assistant opens
- Voice recording begins
- The related Salesforce customer/account information is preloaded

Displayed Context:

- Customer Name
 - Scheduled Event
 - Account Information
 - Open Opportunities
 - Previous Activities
-

Step 4 – Conversational Data Collection

The AI assistant asks natural conversational questions such as:

Event Information

- “How did the meeting go?”

- “Was the customer available?”
- “How long did the visit last?”
- “Would you classify this interaction as successful?”

Opportunity Information

- “Did you discuss any new sales opportunities?”
- “Was there any change in the opportunity stage?”
- “Did the customer mention budget or timeline updates?”
- “Would you like to update the opportunity amount or probability?”

Account Information

- “Did any account information change?”
- “Were there any new stakeholders introduced?”
- “Did the customer mention any risks or escalations?”

Follow-Up Actions

- “Would you like me to create a follow-up task?”
- “Should I schedule another meeting?”
- “Do you want to assign any action items?”

Step 5 – AI Interpretation & Mapping

The AI engine interprets the conversation and maps responses into Salesforce-compatible fields and entities.

Possible mapped objects:

- Event
- Task
- Opportunity
- Account Notes

- Follow-Up Activities
 - Contact Updates
-

Step 6 – Review Summary Screen

Before submission, the application presents a structured summary showing:

- Extracted notes
- Updated fields
- Suggested CRM updates
- New tasks/events created

The sales agent can:

- Edit information
 - Remove entries
 - Confirm submission
-

Step 7 – Save to Salesforce

After confirmation:

- Information is synchronized with Salesforce
 - Related objects are updated
 - Confirmation message is displayed
-

Supported Salesforce Objects

Object	Example Fields
---------------	-----------------------

Event	Subject, Date, Duration, Outcome
Opportunity	Stage, Amount, Probability, Notes
Account	Customer Status, Risks, Stakeholders
Task	Follow-Up Actions, Due Date
Contact	Meeting Participants, Roles

Functional Requirements

FR1 – Geofence Detection

The system shall detect when a sales agent enters a scheduled customer visit radius.

FR2 – Arrival Notification

The system shall trigger a push notification upon arrival.

FR3 – Voice Interaction

The system shall support voice-based conversational data entry.

FR4 – Natural Language Processing

The AI assistant shall interpret natural speech and identify Salesforce-related data points.

FR5 – Salesforce Object Mapping

The system shall map extracted information into Salesforce entities and fields.

FR6 – Multi-Object Support

The system shall allow a single interaction to update multiple Salesforce objects simultaneously.

FR7 – Review & Confirmation

The system shall provide a confirmation screen before submission.

FR8 – Screenshot Attachments

The user shall be able to attach screenshots/images during or after the interaction.

FR9 – Offline Queue Support

If internet connectivity is unavailable:

- Responses are stored locally
 - Synchronization occurs automatically when connectivity is restored
-

Acceptance Criteria

AC1 – Notification on Arrival

Given the sales agent enters the customer geofence
When the scheduled visit is active
Then the user receives a visit registration notification.

AC2 – AI Voice Session Start

Given the user selects “Start Voice Registration”
When the AI assistant opens
Then the system begins conversational voice interaction.

AC3 – Salesforce Context Preload

Given the interaction begins
When customer information is retrieved
Then related Salesforce records are preloaded into context.

AC4 – Opportunity Updates

Given opportunity-related information is discussed
When the AI identifies opportunity changes
Then the system prepares Salesforce opportunity updates.

AC5 – Multi-Entity Registration

Given the conversation includes multiple CRM topics

When the interaction is processed

Then the system updates all applicable Salesforce entities.

AC6 – Review Before Submission

Given the interaction is complete

When AI-generated updates are displayed

Then the sales agent can review and modify the information before saving.

AC7 – Screenshot Attachment

Given the user wants to provide supporting evidence

When screenshots are attached

Then they are linked to the corresponding CRM activity.

UI / UX Expectations

Main Interaction Principles

- Minimal manual typing
- Conversational and natural interaction
- One-handed usability
- Fast completion during field work
- Clear AI-generated summaries

Suggested Screens & References

1. Customer Account Context Screen

(Reference: Salesforce Account View Screenshot)

Displays:

- Account details
- Cases
- Notes & attachments
- Contacts
- Customer history

Purpose:

Provide AI contextual awareness before beginning voice registration.

2. Opportunity Information Screen

(Reference: Salesforce Opportunity Screenshot)

Displays:

- Opportunity stage
- Amount
- Close date
- Probability
- Next steps

Purpose:

Allow opportunity updates during the visit registration flow.

3. Activity Timeline Screen

(Reference: Salesforce Activity Timeline Screenshot)

Displays:

- Upcoming tasks
- Historical interactions
- Follow-ups
- Calls and meetings

Purpose:

Enable contextual AI suggestions and follow-up generation.

4. Task / Follow-Up Screen

(Reference: Salesforce Task Screenshot)

Displays:

- Follow-up tasks
- Due dates
- Status
- Assigned user

Purpose:

Create action items resulting from the customer visit.

Non-Functional Requirements

- Voice transcription response under 2 seconds
- Secure encrypted voice processing
- Salesforce synchronization reliability above 99%
- Mobile battery optimization for geofencing
- Support for Android and iOS

- GDPR/security compliance for voice data handling
-

Dependencies

- Salesforce API Integration
 - Mobile Geolocation Services
 - Push Notification Service
 - AI/NLP Voice Processing Engine
 - Speech-to-Text Service
 - File/Image Upload Service
-

Risks & Considerations

Risk	Mitigation
Incorrect AI interpretation	User review before submission
GPS inaccuracies	Configurable geofence radius
Poor audio quality	Manual correction capability
Connectivity issues	Offline synchronization queue

Out of Scope

- AI-generated sales recommendations

- Predictive opportunity scoring
 - Automatic opportunity closure
 - Voice biometric authentication
 - Real-time customer sentiment analysis
-

Definition of Done

- Geofence detection implemented
- Push notification functioning
- AI conversational flow operational
- Salesforce field mapping validated
- Multi-object update support implemented
- Screenshot attachment functionality completed
- Offline support tested
- QA/UAT approved
- Product Owner sign-off completed
