

Item Type	ID / Number	Title / Component Name	Focus / User Story Requirement Statement	Detailed Description / Acceptance Criteria															
User Story	US-AI-001	AI Field Sales Assistant Workspace	As a Field Sales Rep, I want a proactive AI assistant that pushes contextual pre-meeting briefings and prompts hands-free post-meeting voice debriefs, So that I can walk into every meeting fully prepared and instantly log comprehensive CRM updates, task updates, and follow-up metrics without manual typing while driving.	Acceptance Criteria: • AC 1: System must fire a push notification briefing exactly 15 minutes before a scheduled calendar/route event. • AC 2: The pre-meeting briefing must aggregate historical Salesforce data, open tasks, and recent client topics into a scannable summary. • AC 3: System must auto-detect meeting conclusion (either via a 30-minute timer or a geofenced checkout event) and trigger an immediate post-visit notification. • AC 4: The post-meeting interface must accept continuous streaming voice dictation to capture the debrief. • AC 5: The AI NLP engine must accurately extract and map data fields for: Visit Length, Topics Discussed, Opportunity Updates, Task Statuses, Follow-up Actions, and Future Meeting Dates. • AC 6: Extracted metrics must automatically sync with Salesforce records and update the manager's behavior KPIs.															
				Build the background event listener engine that monitors the rep's calendar schedules and active device location vectors. This epic covers triggering the "Pre-Meeting Alert" based on transit timing and firing the "Post-Meeting Briefing Request" upon geofence departure or an automated 30-minute meeting window threshold.															
Epic	EPIC-01	Dynamic Field Trigger & Notification Infrastructure	Temporal and spatial event routing.	Integrate the app backend with a Large Language Model (LLM) pipeline to generate real-time client summaries. When an early-alert trigger fires, this module must query Salesforce Account, Contact, and Lead histories, isolate open roadblocks or previous discussion logs, and format them into a hyper-concise executive brief tailored for mobile viewports.															
Epic	EPIC-02	LLM-Powered Pre-Meeting Briefing Assembly	Data aggregation and content synthesis.	Develop the core voice-to-text processing engine used for the post-meeting debrief. This pipeline must take raw unstructured conversational audio recorded by the rep and parse out a strict JSON schema containing:															
Epic	EPIC-03	Post-Meeting Multi-Entity NLP Extraction Pipeline	Voice ingestion and structured data parsing.	• Temporal Data: Physical meeting duration (cross-referenced against geofence data). • Commercial Data: Opportunities identified or altered. • Administrative Data: Complete action items, updated task check-lists, and requested future follow-up meetings.															
				Engineer the system layer that handles the downstream execution of the AI's parsed entities. It must translate the extracted JSON payload into parallel Salesforce API calls to update records, mark tasks closed, generate new follow-up tasks, and log calendar events, while updating internal database indicators for manager analytics dashboards.															
Epic	EPIC-04	Salesforce Writeback Optimization & KPI Sync	Database integrity and API threshold management.	Design the user experience for the assistant's mobile layout. This includes building the single-tap conversational sheet, the interactive transcription visualization window, and a post-parsing confirmation screen where reps can view the fields the AI successfully extracted before confirming the upload to Salesforce.															
Epic	EPIC-05	Gamified Rep Voice UI Workspace	Front-End mobile interface and experience hooks.
